# QUESTIONS

## **Year 2: Intermediate Avionics Systems**

### **Subject 3: Flight Instruments & Display Panels**

#### **1. What displays altitude in flight?**

- a) Altimeter
- b) Attitude indicator
- c) Vertical speed indicator
- d) Airspeed indicator

**Correct Answer: a) Altimeter**

**Explanation:** An altimeter measures the aircraft's altitude by comparing the atmospheric pressure outside the aircraft to a pre-measured standard pressure. As altitude increases, air pressure decreases, allowing the altimeter to provide altitude information in ft or meters, which is crucial for safe navigation and maintaining flight levels.

#### **2. Which instrument shows aircraft orientation?**

- a) Heading indicator
- b) Airspeed indicator
- c) Attitude indicator
- d) Altimeter

**Correct Answer: c) Attitude indicator**

**Explanation:** The attitude indicator displays the aircraft's orientation relative to the horizon. It indicates whether the wings are level or if the aircraft is climbing, descending, or banking. This information is essential for pilots to maintain controlled flight, especially in poor visibility conditions where visual references are limited.

#### **3. What measures aircraft speed?**

- a) Gyrocompass
- b) Altimeter
- c) Attitude indicator
- d) Airspeed indicator

**Correct Answer: d) Airspeed indicator**

**Explanation:** The airspeed indicator measures the speed of the aircraft relative to the surrounding air. It utilizes the difference between static pressure and dynamic pressure to provide readings in knots, mi per hour, or kilometers per hour. Accurate airspeed readings are vital for flight safety, especially during takeoff and landing.

#### **4. What is the purpose of a VSI?**

- a) Indicates vertical speed
- b) Shows airspeed
- c) Measures heading
- d) Displays altitude

**Correct Answer: a) Indicates vertical speed**

**Explanation:** A Vertical Speed Indicator (VSI) measures the rate of climb or descent of an aircraft in ft/min. It helps pilots understand how quickly they are ascending or descending, allowing for better control during flight operations. This information is critical for safe altitude management during climbs and descents.

#### **5. Which indicates heading direction?**

- a) Altimeter
- b) Magnetic compass
- c) Attitude indicator
- d) Airspeed indicator

**Correct Answer: b) Magnetic compass**

**Explanation:** The magnetic compass shows the aircraft's heading relative to magnetic north. It is a fundamental navigation instrument that assists pilots in maintaining a desired flight path. Pilots must regularly cross-check the compass with other navigation aids, as magnetic deviation can occur due to nearby metallic objects and electronic equipment.

#### **6. What does an altimeter measure?**

- a) Speed
- b) Pressure
- c) Orientation
- d) Temperature

**Correct Answer: b) Pressure**

**Explanation:** An altimeter measures the atmospheric pressure outside the aircraft to determine altitude. It operates on the principle that air pressure decreases with altitude. Pilots set the altimeter to the local pressure setting to ensure accurate altitude readings, which is crucial for safe navigation and obstacle avoidance during flight.

### 7. What is an EADI?

- a) Emergency altitude display indicator
- b) Electronic airspeed display interface
- c) Enhanced airspeed display indicator
- d) Electronic attitude display indicator

**Correct Answer: d) Electronic attitude display indicator**

**Explanation:** The Electronic Attitude Display Indicator (EADI) is a digital instrument that provides the same information as a traditional attitude indicator but in a more advanced format. It displays the aircraft's orientation in three-dimensional space, allowing pilots to quickly assess their flight position and adjust as necessary, particularly in complex flight scenarios.

### 8. Which instrument uses pitot tube?

- a) Altimeter
- b) Gyrocompass
- c) VSI
- d) Airspeed indicator

**Correct Answer: d) Airspeed indicator**

**Explanation:** The airspeed indicator uses a pitot tube to measure dynamic pressure, which is the difference between still air and airflow around the aircraft. This pressure change is converted into an airspeed reading. It is essential for pilots to understand their speed relative to the surrounding air for safe flight operations, especially during critical phases like takeoff and landing.

### 9. What does a digital display offer?

- a) Enhanced clarity
- b) Analog representation
- c) Limited information
- d) Manual readings

**Correct Answer: a) Enhanced clarity**

**Explanation:** Digital displays in cockpits provide enhanced clarity and precision in presenting flight data. They can offer multiple data points simultaneously, making it easier for pilots to interpret essential information quickly. This feature is particularly beneficial during high-stress situations, allowing for more efficient decision-making and improved situational awareness.

**10. What does the attitude indicator show?**

- a) Heading
- b) Airspeed
- c) Orientation
- d) Altitude

**Correct Answer: c) Orientation**

**Explanation:** The attitude indicator shows the aircraft's orientation to the horizon, indicating whether it is climbing, descending, or in level flight. It uses a gyroscope to maintain a stable reference point. This instrument is vital for pilots to understand their aircraft's position in three-dimensional space, especially in low-visibility conditions where visual references may be unavailable.

**11. What does an altimeter setting adjust for?**

- a) Wind
- b) Weight
- c) Pressure changes
- d) Speed

**Correct Answer: c) Pressure changes**

**Explanation:** The altimeter setting is adjusted based on local atmospheric pressure to ensure accurate altitude readings. Pilots need to set the altimeter to the local pressure to compensate for changes in weather conditions. This adjustment is crucial for maintaining safe flight levels and avoiding terrain or obstacles during flight operations.

**12. What does a VSI indicate?**

- a) Airspeed
- b) Heading
- c) Altitude
- d) Climb or descent

**Correct Answer: d) Climb or descent**

**Explanation:** The Vertical Speed Indicator (VSI) indicates whether the aircraft is climbing or descending and at what rate, measured in ft/min. This information is essential for pilots during ascent and descent phases of flight, allowing for controlled altitude management and compliance with air traffic control instructions.

**13. Which instrument uses static pressure?**

- a) Attitude indicator
- b) Altimeter
- c) Vertical speed indicator
- d) Airspeed indicator

**Correct Answer: b) Altimeter**

**Explanation:** The altimeter utilizes static pressure to determine the aircraft's altitude. It measures the atmospheric pressure outside the aircraft and compares it to a standard reference. Changes in altitude are reflected in the altimeter reading, making it a critical instrument for pilots in ensuring safe and accurate flight navigation.

**14. How is airspeed calculated?**

- a) Comparing pressures
- b) Using temperature
- c) By altitude
- d) Using GPS

**Correct Answer: a) Comparing pressures**

**Explanation:** Airspeed is calculated by comparing the dynamic pressure, measured by the pitot tube, with the static pressure. This difference allows the airspeed indicator to display the aircraft's speed relative to the surrounding air. Understanding airspeed is vital for safe aircraft operation, especially during takeoff, landing, and maneuvering.

**15. What does the heading indicator show?**

- a) Altitude
- b) Direction
- c) Vertical speed
- d) Airspeed

**Correct Answer: b) Direction**

**Explanation:** The heading indicator shows the aircraft's current direction relative to magnetic or true north. It is essential for navigation, allowing pilots to maintain a specific course and make necessary adjustments during flight. Regular checks against other navigation tools are important to ensure accuracy and compensate for magnetic variation.

**16. Which instrument provides altitude changes?**

- a) Airspeed indicator
- b) VSI
- c) Attitude indicator
- d) Heading indicator

**Correct Answer: b) VSI**

**Explanation:** The Vertical Speed Indicator (VSI) provides information about altitude changes by indicating the rate of climb or descent. It helps pilots understand how quickly they are changing altitude, which is crucial during takeoffs, landings, and when following altitude instructions from air traffic control.

**17. What displays aircraft's speed relative to air?**

- a) VSI
- b) Altimeter
- c) Gyrocompass
- d) Airspeed indicator

**Correct Answer: d) Airspeed indicator**

**Explanation:** The airspeed indicator displays the aircraft's speed relative to the surrounding air, utilizing a pitot-static system to measure the difference between dynamic and static pressure. This information is vital for pilots to maintain control and ensure safe operation, particularly during critical phases of flight such as takeoff and landing.

**18. What does a digital altimeter show?**

- a) Pressure only
- b) Analog readings
- c) Speed in knots
- d) Altitude in digits

**Correct Answer: d) Altitude in digits**

**Explanation:** A digital altimeter provides altitude information in numerical form, allowing pilots to read their altitude quickly and accurately. This technology enhances pilot situational awareness, especially in low-visibility conditions, and helps reduce the likelihood of misinterpretation compared to traditional analog altimeters, which can be more challenging to read quickly.

**19. What is the purpose of a airspeed indicator?**

- a) Show wind speed
- b) Display altitude
- c) Measure temperature
- d) Indicate aircraft speed

**Correct Answer: d) Indicate aircraft speed**

**Explanation:** The airspeed indicator is designed to measure and display the speed of the aircraft relative to the surrounding air. It is crucial for ensuring the aircraft remains within safe operating parameters during various phases of flight, such as takeoff and landing, where precise speed control is essential for safety.

**20. What is indicated by a heading indicator?**

- a) Aircraft speed
- b) Direction of travel
- c) Climb rate
- d) Altitude

**Correct Answer: b) Direction of travel**

**Explanation:** The heading indicator shows the direction in which the aircraft is traveling, usually relative to magnetic north. This instrument is vital for navigation, helping pilots to maintain desired flight paths and make adjustments as necessary. Accurate heading information is essential for successful route management and avoiding navigational errors.

**21. What does the VSI measure?**

- a) Airspeed
- b) Rate of climb
- c) Aircraft direction
- d) Altimeter readings

**Correct Answer: b) Rate of climb**
